● ENVIRONMENTAL
HEALTH

● (1)

● Dr Khalid El Tohami

● OJECTIVES

- To describe environment and health
- To explain exposure and dose
- To assess the hazards from different environmental factors
 - Environment

- Environment :
= The external factors (living – non living – material – non material) which surrounds man.
 - Descriptive classification:
 - Physical: water, air, housing, etc.
 - Biological: animal, plant, etc.
 - Social: customs, income, etc.
 - Bad or poor environment leads to ill-health
 - Man responsible for pollution
- WHO definition:
- “ The control of all those factors in man’s physical environment

which exercise or may exercise a deleterious effect on his physical development, health & survival.”

- So now it called
ENVIRONMENTAL HEALTH
- Its purpose is to create & maintain ecological conditions that will promote health & prevent disease
- It is complex, needs a multi-disciplinary programme of action

Explain exposure and dose ●

- **Exposure**

- **Any condition which provides an opportunity for an external environmental agent to enter the body**

- Examples of Exposure**

- „ **Contaminated groundwater**

- **Ingestion (drinking water)**

- **Dermal contact (bathing)**

- **Inhalation (during showering)**

- „ **Contaminated surface water**

- **Explain exposure and dose**

- **Contaminated surface soil**
 - **dermal absorption of contaminants**
- - „ **Contaminated food**
 - **Ingestion of contaminated muscle tissue or vegetables**
 - „ **Contaminated air**
 - **Inhalation of “fugitive dusts”**
- **Explain exposure and dose**
- **Dose**
 - **The amount of agent actually deposited within the**

body, Typically, the distinction between exposure and dose is blurred, although in reality, significantly different doses can result from the same exposure

- **Assess the hazards from different environmental factors**
- **Risk assessment**
 - **The determination of the probability that an adverse effect will result from a defined exposure**
- **Risk management**
 - **The process of weighing**

**different policies and selecting
the most appropriate
intervention
strategy based on the
results of risk assessment and
social, economic, political
concerns.**

- **Assess the hazards from
different environmental
factors**
- **Risk Assessment Activities**
 - 1. Hazard identification**
 - **Characterize the innate toxic
effect of the agent**
 - 2. Exposure assessment**
 - **Measure or estimate the
intensity, frequency,**

and duration of human exposure to the agent

- **Assess the hazards from different environmental factors**

3. Dose-response assessment
– **Characterize the relationships between varying doses and adverse effects in exposed populations**

4. Risk characterization
– **Estimate the incidence of**

health effects of exposure

● INTRODUCTION

- One of the essential public health care element is safe drinking water & sanitation.
- Water is one of the physical component of the environment
- It is not only a vital environmental factor to all forms of life, but has a great role in socio-economic development.
- Lack of water ill health
- No state of positive health & well-being without safe water

SAFE & WHOLESOME ● WATER

- Free from pathogenic agents
- Free from harmful chemical substances
- Free from color and taste
- Usable for domestic purposes

If not so we call it polluted or contaminated water

Water requirement ●

- Basic physiological requirement =

liters/head/day

2

- Public health (domestic purposes) =

150-200 liters/head/day

- Uses of water

- ⑩ Domestic use
- ⑩ Public purposes
- ⑩ Industrial purposes
- ⑩ Agricultural purposes
- ⑩ Power production
- ⑩ Carrying away waste

- Sources of water supply

Water source must be:

- ⑩ Sufficient in quantity
- ⑩ Acceptable in quality

Three main sources:

- Rain

- Surface water
 - Impounding Reservoirs Rivers & Streams
 - Tanks, Ponds, & Lakes
- Ground water
 - Shallow Wells Deep Wells
 - Springs

- 1. Rain

Characteristics:

Physically : Purest water – clear –
bright – sparkling

Chemically: soft (only 0.0005
dissolved solids)

Bacteriologically: from clean districts
free from pathogenic agents

Impurities

Dust – soot – microorganisms –
carbon dioxide – nitrogen – oxygen
& ammonia

Acid rains (gaseous sulphur – nitrogen oxide)

- 2. Surface Water

- Include : rivers, tanks, lakes, wades, sea, man made reservoirs
- It prone to contamination so it never safe without sanitary protection & purification.
- *Impurities*: depends on the catchment area

- PURIFICATION OF WATER

- On large scale
 - Storage

- Filtration
- Disinfection
- On small scale
 - Household purification of water
 - Disinfection of wells

STORAGE ●

- during which some natural purification take place

physical: impurities settle by gravity

chemical: oxidation =
dec.amonia & inc. nitrares

biological: death of 90% of
microorganisms in

5-7 days.

(optimum=10-14)

● FILTRATION

● *Slow sand or biological filters*

Simple, easy, cheap, high quality treatment

● *Rapid sand or mechanical filters*

Deals directly with raw water, less space, rapid, more flexible, easy washing

● DISINFECTION

● Criteria of useful water disinfectant

- powerful within time & not affected by water properties
- no product of reaction

- cheap, safe, with accurate application to water
- property of leaving residual concentration
- easy detectable by rapid simple techniques

- Chlorination
- Ozonation
- Ultraviolet irradiation
- PURIFICATION ON SMALL SCALE

⑩ Household purification

boiling:

chemical disinfection: (bleaching powder, chlorine solution, high test hypochlorite, chlorine tablets, iodine, potassium permanganate)

filtration:

⑩ Disinfection of wells

- 1.1 billion = no access to safe water
- 2.4 billion = no access to basic sanitation
- 2.2 million = die each year from diarrhoea

dr.

G.H. Brundtland message

AIR POLLUTION ●

Air pollution ; ●

- **Is the presence in the ambient (surrounding) atmosphere of substances (e.g. gases, mixtures, and particulate matter) generated by the activities of man in concentrations that interfere**

with human health, safety, or are injurious to vegetation and animals and other environmental media.

Sources of air pollution ●

➤ Motor vehicles, especially in urban areas. They emit:

-hydrocarbons

-nitrogen oxides

-carbon monoxide

-lead

-black smoke and malodorous fumes.

➤ Industries:

**combustion of fuel to
generate heat and power
smoke, SO₂, NO, and fly ash.
petrochemical industries
HCl, and organic halides.
other industries CO,
CO₂, ozone, H₂S, SO₂.....etc**

- **Domestic sources:
Domestic combustion of
coal, wood, or oil is a major
source of smoke, dust, SO₂,
and NO.**

- **Tobacco smoke:**
 - Most direct and important source of air pollution.**
 - active smokers**
 - passive smokers**

- **Miscellaneous:**
 - These comprise:**
 - burning refuse**
 - incinerators**
 - pesticide spraying**
 - natural sources**
(windborne dust, fungi, moulds, bacteria)
 - nuclear energy programs.**

Effects Of Air Pollution ●

- **About 1.3 billion urban residents worldwide are exposed to air pollution level above recommended levels**
- **2 aspects to be taken into consideration:**
 - Health aspect**
 - Social and economic aspect.**

● **HEALTH**

- ❖ Damages the human respiratory systems.
- ❖ Both immediate and delayed effects.
 - immediate:
suffocation and death.
 - delayed: chronic bronchitis, cancer, bronchial asthma, emphysema, and allergies

❖ **Lead poisoning in children.**

● **SOCIAL AND ECONOMIC ASPECTS**

✓

✓ **Destruction of animal and plant life.**

✓ **Corrosion of metals.**

✓ **Damage to buildings.**

✓ **Cost of cleaning and maintenance.**

● THANKS
