## B. Course Objectives and Learning Outcomes

### 1. Course Description

This course gives students a set of formal mathematical tools for defining and implementing the semantics of a language and demonstrates them in the context of important real-world programming languages, with emphasis on theoretical properties of type systems.

### 2. Course Main Objective

To acquire the fundamental concepts of programming languages and techniques to discuss and compare features of several popular programming paradigms such as imperative, object oriented, functional, and logic programming. Understand how to examine modern programming languages and features: abstract data and control structures, procedures, parameter passing mechanisms, block structuring and scope rules, input/output, and storage management.
